

Lecture 10: Functions and Recursion – Part II

Class page: <https://github.com/tsung-wei-huang/cs1410-40>

Dr. Tsung-Wei Huang
Department of Electrical and Computer Engineering
University of Utah, Salt Lake City, UT

Recap: Function Definition

- The format of a function definition is as follows:

```
return-value-type function-name( parameter-list )  
{  
    declarations and statements  
}
```

- The *function-name* is any valid identifier.
- The *return-value-type* is the data type of the returned result to the caller.
 - The type `void` indicates that a function does not return a value.
- All variables defined in a function are **local variables**—they're known only in the function in which they're defined.
- Most functions have a list of **parameters** that provide the means for communicating information between functions.
 - A function's parameters are also local variables of that function.

Example

```
1 // Creating and using a programmer-defined function.
2 #include <iostream>
3 using namespace std;
4
5 int square( int ); // function prototype
6
7 int main()
8 {
9     // Loop 10 times and calculate and output the
10    // square of x each time
11    for ( int x = 1; x <= 10; x++ )
12        cout << square( x ) << " ";
13    // function call
14
15    cout << endl;
16 } // end main
17
18 // square function definition returns square of an integer
19 int square( int y ) // y is a copy of argument to function
20 {
21     return y * y;      // returns square of y as an int
22 } // end function square
```

Practice 1: Lower Bound of Sum

Write a function named "boundary" that takes one integer argument, call it "goal" and returns as its value the smallest positive integer n for which $1+2+3+\dots+n$ is at least equal or larger than "goal"

e.g. goal = 9, function returns 4, as $1+2+3+4 \geq 9$ but $1+2+3 < 9$

e.g., goal=21, function return 6, as $1+2+3+4+5+6=21$ but $1+2+3+4+5 < 21$

Practice 2: GCD

Write a function named "gcd" that takes two positive integers and return their greatest common divisor (GCD)

e.g. $\text{gcd}(1220, 516) = 4$

$$\begin{array}{r} 1220 \text{ mod } 516 = 188 \\ 516 \text{ mod } 188 = 140 \\ 188 \text{ mod } 140 = 48 \\ 140 \text{ mod } 48 = 44 \\ 48 \text{ mod } 44 = 4 \\ 44 \text{ mod } 4 = 0 \\ 4 = \text{GCD} \end{array}$$

Call by Value vs Call by Reference

Call by value

- copies the actual **value** of an argument into the formal parameter of the function

Call by reference

- copies the address of an argument into the formal parameter

Call by Value vs Call by Reference

```
1 // Comparing pass-by-value and pass-by-reference with references.
2 #include <iostream>
3 using namespace std;
4
5
6 int squareByValue( int ); // function prototype (value pass)
7 void squareByReference( int & ); // function prototype (reference pass)
8
9 int main()
10 {
11     int x = 2; // value to square using squareByValue
12     int z = 4; // value to square using squareByReference
13
14     // demonstrate squareByValue
15     cout << "x = " << x << " before squareByValue\n";
16     cout << "Value returned by squareByValue: "
17         << squareByValue( x ) << endl;
18     cout << "x = " << x << " after squareByValue\n" << endl;
19
20     // demonstrate squareByReference
21     cout << "z = " << z << " before squareByReference" << endl;
22     squareByReference( z );
23     cout << "z = " << z << " after squareByReference" << endl;
24 } // end main
```

Call by Value vs Call by Reference

```
25
26 // squareByValue multiplies number by itself, stores the
27 // result in number and returns the new value of number
28 int squareByValue( int number )
29 {
30     return number *= number; // caller's argument not modified
31 } // end function squareByValue
32
33 // squareByReference multiplies numberRef by itself and stores the result
34 // in the variable to which numberRef refers in function main
35 void squareByReference( int &numberRef )
36 {
37     numberRef *= numberRef; // caller's argument modified
38 } // end function squareByReference
```

```
x = 2 before squareByValue
Value returned by squareByValue: 4
x = 2 after squareByValue
```

```
z = 4 before squareByReference
z = 16 after squareByReference
```

Reference is "Alias"

- References can also be used as aliases for other variables within a function.
- For example, the code

```
int count = 1; // declare integer variable  
count  
int &cRef = count; // create cRef as an alias  
for count  
cRef++; // increment count (using its alias  
cRef)
```

increments variable **count** by using its alias **cRef**.

- Reference variables must be initialized in their declarations and cannot be reassigned as aliases to other variables.
- Once a reference is declared as an alias for another variable, all operations performed on the alias are actually performed on the original variable.

Reference is “Alias”

```
1 // Initializing and using a reference.
2 #include <iostream>
3 using namespace std;
4
5
6 int main()
7 {
8     int x = 3;
9     int &y = x; // y refers to (is an alias for) x
10
11    cout << "x = " << x << endl << "y = " << y << endl;
12    y = 7; // actually modifies x
13    cout << "x = " << x << endl << "y = " << y << endl;
14 } // end main
```

```
x = 3
y = 3
x = 7
y = 7
```

Reference must be Initialized!

```
1 // References must be initialized.
2 #include <iostream>
3 using namespace std;
4
5 int main()
6 {
7     int x = 3;
8     int &y; // Error: y must be initialized
9
10    cout << "x = " << x << endl << "y = " << y << endl;
11    y = 7;
12    cout << "x = " << x << endl << "y = " << y << endl;
13
14 } // end main
```

Recursive Function

- A **recursive function** is a function that calls itself, either directly, or indirectly (through another function).
- The function only knows how to solve the simplest case(s), or so-called **base case(s)**.
 - If the function is called with a base case, the function simply returns a result
 - For complex problem, the function divides a problem into
 - What it can do (base case) → return the result
 - What it cannot do → resemble the original problem, but be a slightly simpler or smaller version
 - The function calls a new copy of itself (**recursion step**) to solve the smaller problem
- Eventually base case gets solved
 - Gets plugged in, works its way up and solves whole problem

Practice 3: Fibonacci Number (iterative)

Write a function named "fib" that takes a positive integer N and returns the N-th Fibonacci number

e.g. N=6, returns 8

e.g. N=9, returns 34

1,1,2,3,5,8,13,21,34,55,89,144,233,377...

$$1+1=2$$

$$1+2=3$$

$$2+3=5$$

$$3+5=8$$

$$5+8=13$$

$$8+13=21$$

$$13+21=34$$

$$21+34=55$$

$$34+55=89$$

$$55+89=144$$

$$89+144=233$$

$$144+233=377$$

Practice 4: Fibonacci Number (Recursive)

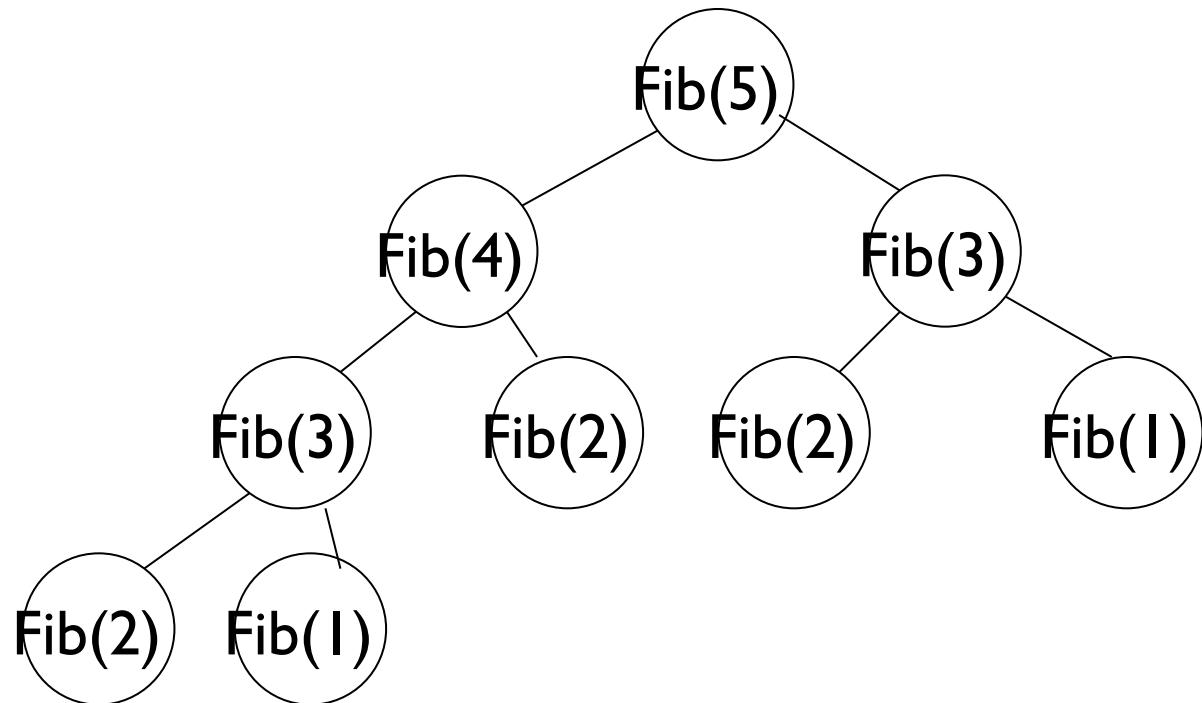

Write a function named "fib" that takes a positive integer N and returns the N-th Fibonacci number

e.g. N=6, returns 8

e.g. N=9, returns 34

1,1,2,3,5,8,13,21,34,55,89,144,233,377...

Duplicate Computations ...

Practice 5: GCD (Recursive)

Write a function named "gcd" that takes two positive integers and return their greatest common divisor (GCD)

e.g. $\text{gcd}(1220, 516) = 4$

$$\begin{array}{r} 1220 \text{ mod } 516 = 188 \\ 516 \text{ mod } 188 = 140 \\ 188 \text{ mod } 140 = 48 \\ 140 \text{ mod } 48 = 44 \\ 48 \text{ mod } 44 = 4 \\ 44 \text{ mod } 4 = 0 \\ 4 = \text{GCD} \end{array}$$

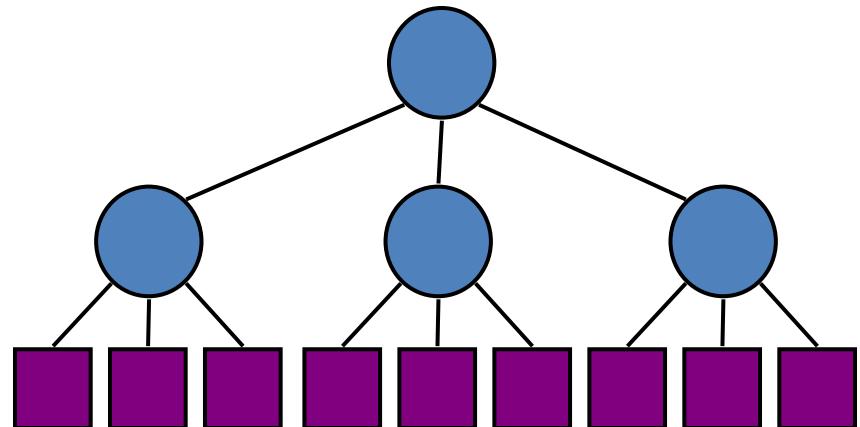

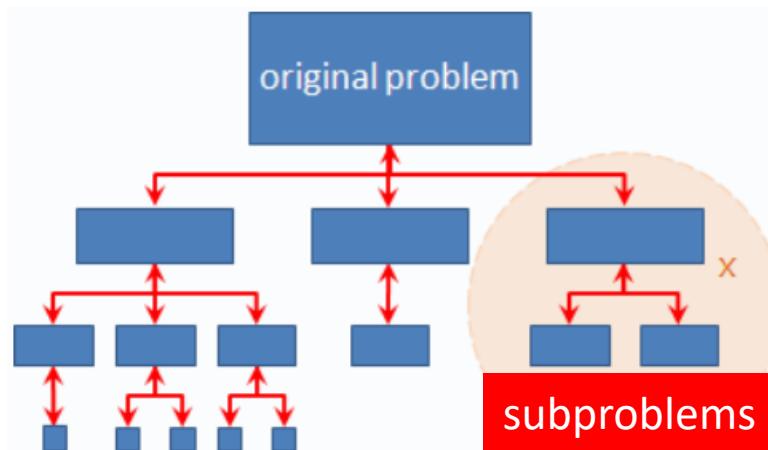

```
graph TD; A[1220 mod 516 = 188] --> B[516 mod 188 = 140]; B --> C[188 mod 140 = 48]; C --> D[140 mod 48 = 44]; D --> E[48 mod 44 = 4]; E --> F[44 mod 4 = 0]; F --> G[4 = GCD];
```

Divide and Conquer

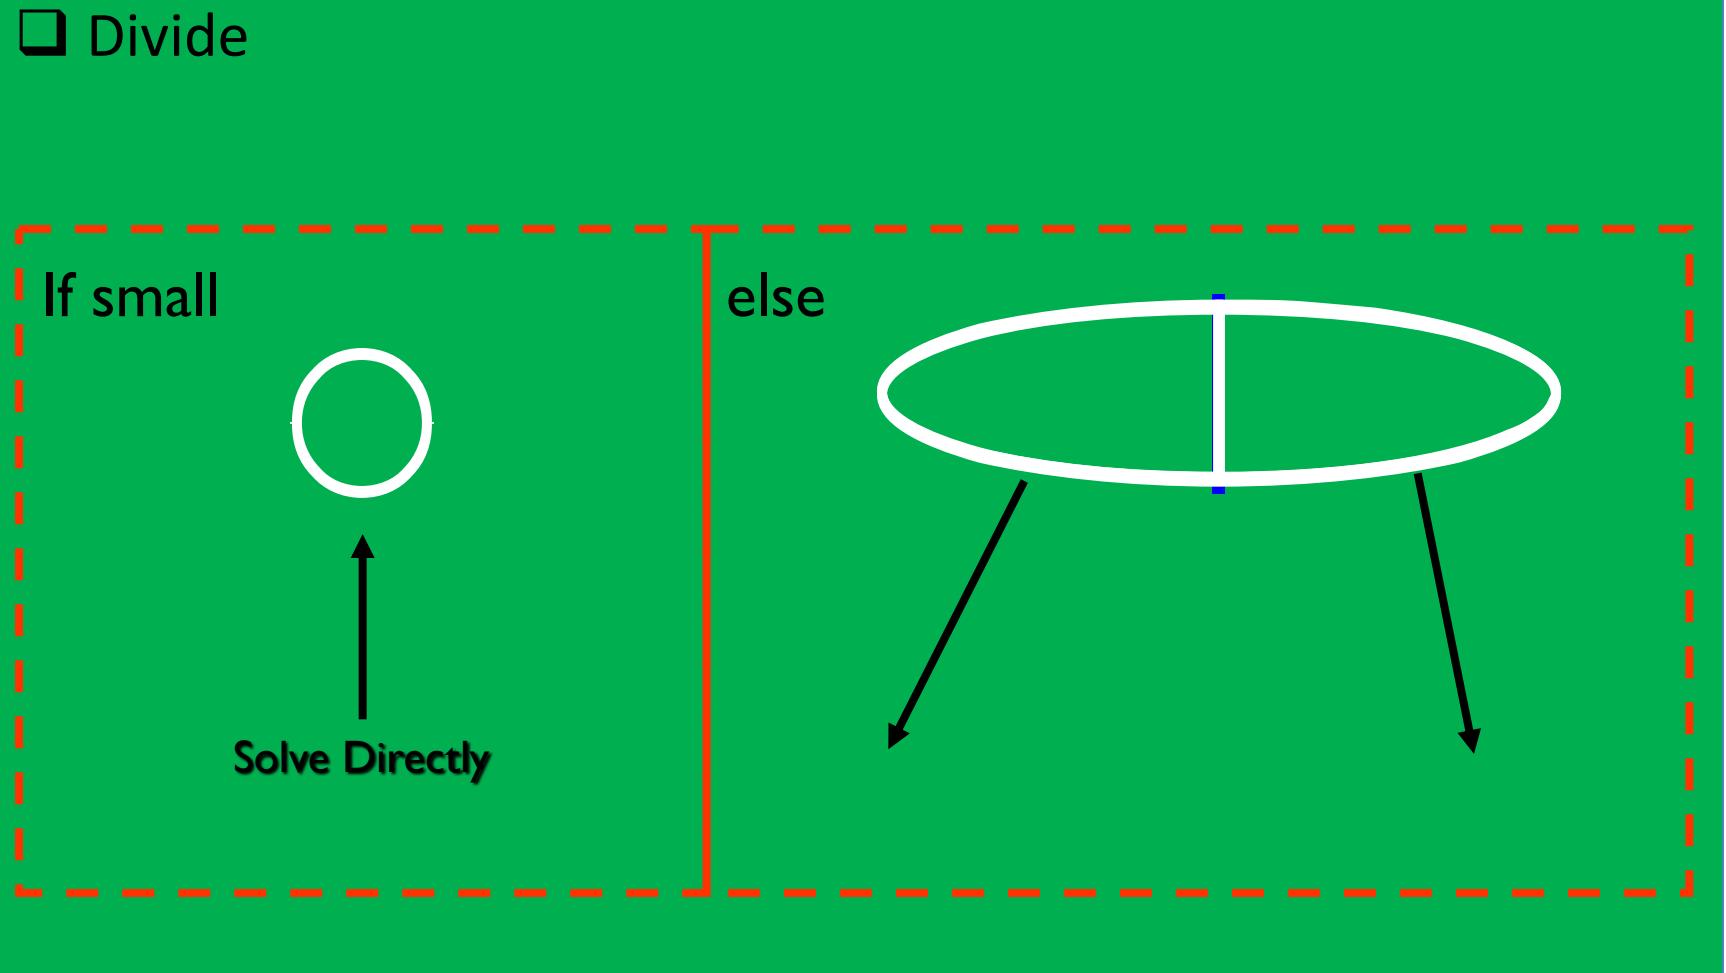

❑ Divide & Conquer

- ❑ Divide: Divide the original problem into smaller subproblems
- ❑ Recurse: Solve each small subproblem recursively
- ❑ Conquer: Combine these subproblems all the way to the top

Divide and Conquer is Heavily used in CAD

- Modern circuits sizes are too large to handle in flat

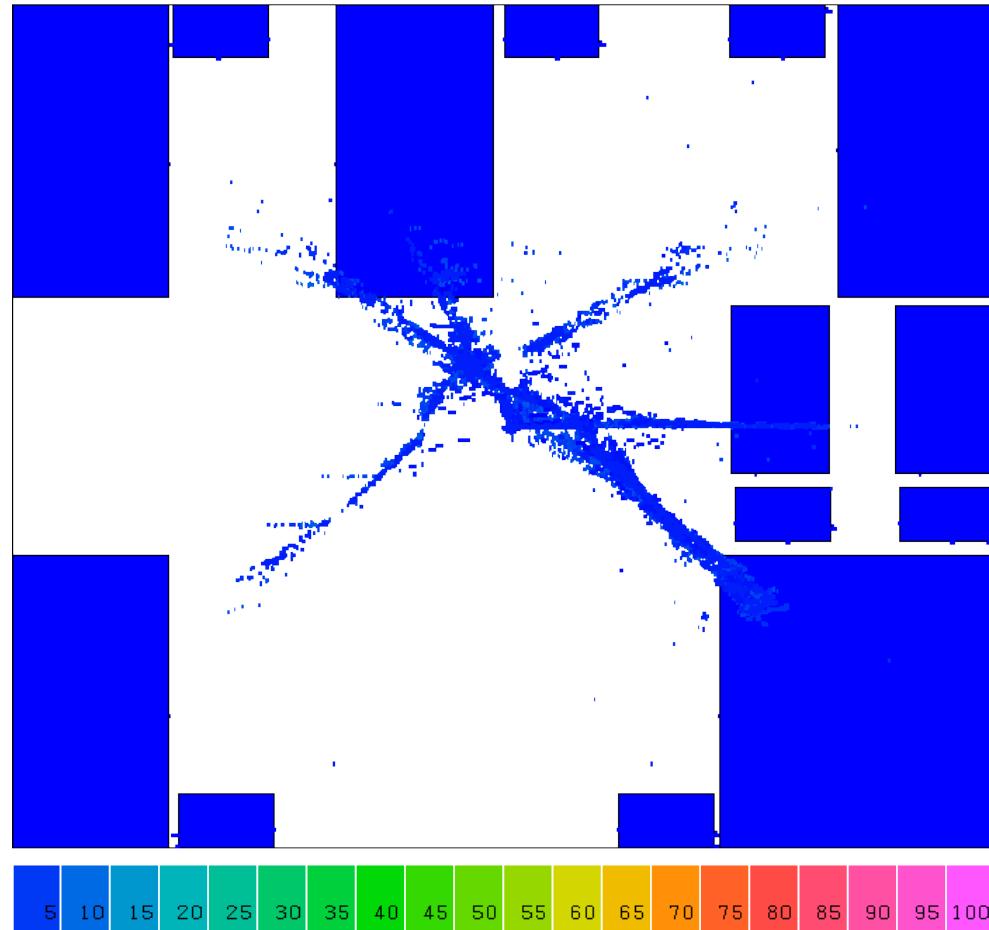

2000 – Intel Pentium4
42M transistors
1.5MHz; 224 mm²

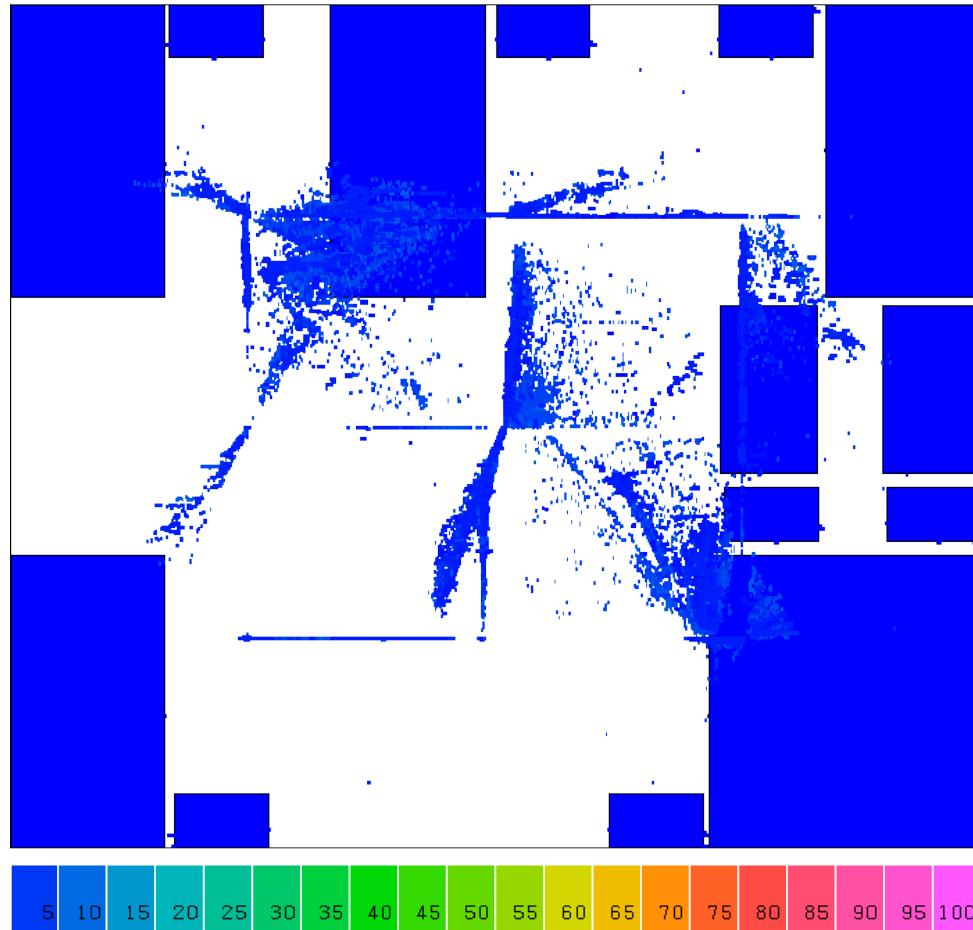

Directly solving the original problem takes forever to finish ...

Summary

- ❑ **Function**
- ❑ **Recursive Function**
- ❑ **Divide and Conquer**
 - ❑ Used to solve 90% of the computer science problems
 - ❑ Break a large problem into smaller pieces
 - ❑ Solve each smaller piece
 - ❑ Merge the solutions
